

NEXUS CLOUD TECHNOLOGIES

Software Engineer I (Backend & Infrastructure)

Location: Seattle, WA / Remote Friendly | Department: Core Engineering | Core Level: Entry / Graduate

About the Role

Nexus Cloud Technologies is seeking an incoming Software Engineer I to join our Cloud Optimization Squad. In this role, you will help design, build, and optimize high-throughput distributed backend services that power real-time metric analytics pipelines for our global enterprise clientele. You will work closely with a cross-functional team of senior engineers, product managers, and site reliability experts to scale robust software layers, improve microservices elasticity, and construct flawless automated pipelines.

Key Responsibilities

- **Backend Engineering:** Design, build, and maintain highly scalable, asynchronous API frameworks and background worker services handling millions of concurrent events.
- **Database & Cache Optimization:** Structure relational schemas, construct heavy queries, and configure caching layers to accelerate data access while minimizing compute latencies.
- **DevOps & CI/CD:** Maintain and optimize test suites, containerize applications, and design declarative configuration pipelines for continuous delivery and zero-downtime rollouts.
- **Agile Collaboration:** Participate in fast-paced Sprint ceremonies, detailing technical specs, reviewing peers' pull requests, and iterating based on architectural feedback.

Required Qualifications (Matching Profile)

- **Education:** Pursuing a Bachelor's degree in Computer Science, Computer Engineering, or a highly mathematical/technical discipline.
- **Programming Languages:** Fluency in modern backend modern languages, specifically **Python, C++, C, or Java**.
- **Frameworks & Databases:** Strong academic or internship experience working with relational engines (**PostgreSQL/MySQL**), key-value caching engines (**Redis**), and modern web architectures (**FastAPI, Express, or Flask**).
- **Infrastructure/Tools:** Direct familiarity with virtualization software (**Docker**), automated cloud pipelines (**GitHub Actions/GitLab CI**), and fundamental Linux environments.
- **Foundational CS Concepts:** Deep understanding of ****Distributed Systems****, ****Algorithm Design & Complexity Analysis****, ****Concurrency Control****, and Object-Oriented paradigms.

Preferred Extras

- Prior technical experience presenting complex concepts (e.g., as an Undergraduate TA or technical tutor).
- Active contributions to open-source software, hackathons (e.g., organizing or competing), or deploying autonomous personal full-stack platforms.
